NEW COMPOUNDS

Field of the invention

5 The present invention is directed to new compounds of high optical purity, a process for their preparation and their use as intermediates in the synthesis of the *S*- or *R*-enantiomer of 5-methoxy-2-[[[4-methoxy-3,5-dimethyl-2-pyridinyl)methyl]sulphinyl]-1*H*-benzimidazole.

Background of the invention

10 The compound 5-methoxy-2-[[[4-methoxy-3,5-dimethyl-2-pyridinyl)methyl]sulphinyl]-1*H*-benzimidazole, having the generic name omeprazole, and therapeutically acceptable alkaline salts thereof are described in EP 5129 and EP 124 495, respectively. Omeprazole
15 and its alkaline salts are effective gastric acid secretion inhibitors, and are useful as antiulcer agents. The compounds, being sulfoxides, have an asymmetric center in the sulphur atom, i.e. exist as two optical isomers (enantiomers). It has been shown that the magnesium salt of the *S*-enantiomer of omeprazole has better pharmacokinetic and
20 metabolic properties compared to omeprazole, and this is described in EP 0 652 872 B1. As a result of this the magnesium salt of the *S*-enantiomer of omeprazole has an improved therapeutic profile such as a lower degree of interindividual variation.

25 In EP 0 773 940 B1 a process for preparation of the single enantiomers of omeprazole and structurally related sulfoxides is described. In this process, a pro-chiral sulphide is

oxidised with an oxidising agent in the presence of a chiral titanium complex into the corresponding sulphoxide either as a single enantiomer or in enantiomerically enriched form.

5 Single enantiomers of omeprazole in neutral form are difficult to obtain in crystalline state and thus these compounds are most frequently obtained as non crystalline products. In for instance WO 92/08716 the neutral form of the R enantiomer of omeprazole is obtained as an amorphous solid and in WO 94/27988 both of the enantiomers of omeprazole - in their neutral forms - are obtained in the form of syrups or oils. In WO 94/27988 is also
10 described the preparation of alkaline salts of the single enantiomers, which are obtainable as crystalline products. These can be purified by recrystallisation resulting in products of very high optical purity. Furthermore, optically pure salts of the S-enantiomer of omeprazole are stable towards racemization both in neutral pH and basic pH.
15 WO 98/28294 discloses S-omeprazole in neutral form that is in a solid state.

It would be desirable to perform the oxidation of pro-chiral sulphides yielding highly crystalline sulphoxide intermediates, thus making it possible to directly recrystallise the crude sulphoxides in its neutral form in order to increase the optical purity as well as to
20 increase the chemical purity. The purified enantiomerically enriched sulphoxide intermediates could then be converted into the S- or R-enantiomer of omeprazole and thereafter optionally into pharmaceutically acceptable salts thereof. An advantage of such a process is that a requisite chemical and optical purification step would not involve the addition of an alkaline medium to a titanium containing reaction mixture, which process is

associated with problems with the formation of inorganic titanium salts that are difficult to work with. A further advantage is if the titanium catalyzed reaction step occurs earlier in the synthesis of the enantiomerically enriched compounds thereby reducing a possible risk of contamination of the final product by titanium salts.

- 5 The present invention relates to new crystalline sulfoxides which are stable enough to be directly recrystallised, the preparation of these sulfoxides and their use as intermediates in the synthesis of *S*- and *R*- enantiomer of omeprazole.

Detailed description of the invention

10

The present invention refers to new highly crystalline sulfoxides in enantiomerically enriched form which are chemically stable enough to be directly crystallised from an oxidation reaction mixture, the preparation of these sulfoxides and their use as intermediates in the synthesis of the *S*- and *R*- enantiomer of omeprazole and

15 pharmaceutically acceptable salts thereof.

According to another aspect of the invention, the new synthetic intermediates are defined by formula I either as a single enantiomer or in enantiomerically enriched form:

I

20

wherein

Het is

and X is a leaving group such as a halogen (F, Cl, Br, I), NO₂, N₂⁺ or -OSO₂R (R is CH₃,
 5 CF₃, p-toluene, m-chlorobenzene, p-chlorobenzene).

According to another aspect of the invention the leaving group X is chloro or nitro as in the
 compounds of formula Ia, Ib, Ic and Id:

The compounds Ia-Id, and their corresponding tautomers, exist either as a single
 enantiomer or in an enantiomerically enriched form.

A further aspect of the invention is the preparation of compounds of formula I, which can
 15 be used as intermediates in the synthesis of the *S*- and *R*- enantiomer of omeprazole and

pharmaceutically acceptable salts thereof. The preparation of the compounds of formula I may be carried out as described in EP 0 773 940 B1, and this is also illustrated in Scheme 1 below.

Scheme 1

wherein Het is

and X is a leaving group such as a halogen (F, Cl, Br, I), NO₂, N₂⁺ or -OSO₂R (R is CH₃, CF₃, p-toluene, m-chlorobenzene, p-chlorobenzene).

In this process, a pro-chiral sulphide such as II is oxidised in an organic solvent with an oxidising agent, e.g. cumene hydroperoxide, in the presence of a chiral titanium complex. The titanium complex suitable for catalysing the process of the invention is prepared from a chiral ligand and a titanium(IV) compound such as preferably a titanium(IV)alkoxide, and optionally in the presence of water. The chiral ligand used in the preparation of the titanium complex is for instance a chiral alcohol such as a chiral diol. The oxidation may be performed in the presence of a base, e.g. N,N-diisopropylethylamine.

The oxidation is carried out in an organic solvent. The solvent can be chosen with respect to suitable conditions from an industrial point of view as well as environmental aspects. Suitable organic solvents are for instance toluene, ethyl acetate, methyl ethyl ketone, methyl isobutyl ketone, diethyl carbonate, tert.butyl methyl ether, tetrahydrofurane, methylene chloride and the like. From an environmental point of view non-chlorinated solvents are preferred.

The oxidation is preferably carried out in an organic solvent at room temperature or just above room temperature, e.g. between 20-40°C. If the reaction time is varied a reaction temperature may be chosen below as well as above the preferred temperatures 20 - 40°C. A suitable temperature range is limited only depending on the decomposition of the compounds, and that the reaction time is dramatically shorter at room temperature than at -20°C since the sulphides of interest are oxidised very slowly at such a low temperature.

An oxidising agent suitable for this asymmetric oxidation may be a hydroperoxide, such as for example tert.-butylhydroperoxide or cumene hydroperoxide, preferably the latter.

The titanium complex suitable for catalysing the process of the invention is prepared from a chiral ligand and a titanium(IV) compound such as preferably titanium(IV)alkoxide, and optionally in the presence of water. An especially preferred titanium(IV)alkoxide is titanium(IV)isopropoxide or -propoxide. The amount of the chiral titanium complex is not critical. An amount of less than approximately 0.50 equivalents is preferred and especially preferred amount is 0.05-0.30 equivalents. Even very low amounts of complex, such as for instance 0.04 equivalents may be used in the processes according to the present invention with excellent result.

The titanium complex may also be prepared by reacting titanium tetrachloride with a chiral ligand in the presence of a base.

- 5 The chiral ligand used in the preparation of the titanium complex is preferably a chiral alcohol such as a chiral diol. The diol may be a branched or unbranched alkyl diol, or an aromatic diol. Preferred chiral diols are esters or tartaric acid, especially (+)-diethyl L-tartrate or (-)-diethyl D-tartrate are preferred.
- 10 The chiral titanium complex may be prepared in the presence of the pro-chiral sulphide or before the pro-chiral sulphide is added to the reaction vessel.

According to one aspect of the invention, the oxidation is carried out in the presence of a base. The base may be an inorganic or an organic base, such as for instance a hydrogen
15 carbonate, an amide or an amine. Amine includes a guanidine or an amidine. Organic bases are preferred and especially suitable bases are amines, preferably triethylamine or N,N-diisopropylethylamine. The amount of base added to the reaction mixture is not critical but should be adjusted with respect to the reaction mixture.

- 20 The preparation of the chiral titanium complex is preferably performed in the presence of the pro-chiral sulphide.

Other essential features in the preparation of the chiral titanium complex is that the preparation of the complex is performed during an elevated temperature and/or a prolonged

time. With an elevated temperature is meant a temperature above room temperature, such as for instance 30 – 70°C, preferably 40 – 60°C. A prolonged preparation time is a period of time longer than approximately 20 minutes, preferably 1 – 5 hours. A suitable period of time for the preparation step depends on the preparation temperature and of the pro-chiral sulphide, optionally present during the preparation of the chiral titanium complex.

Yet a further aspect of the invention is the conversion of compounds of formula I into the *S*- and *R*- enantiomer of omeprazole and pharmaceutically acceptable salts thereof. Scheme 2 and Scheme 3 below describe synthetic routes for converting compound I into the *S*- enantiomer of omeprazole. The same routes can be applied to convert compound I into the *R*-enantiomer of omeprazole provided that the chirality of the chiral titanium complex used in the oxidising reaction step is changed to the opposite of that used for making the corresponding *S*-enantiomer.

Scheme 2

In Scheme 2, the first step is performed as described above. The obtained sulfoxide I may be recrystallised in order to enhance chemical and optical purity. Finally, a substitution

reaction with methoxide, e.g. sodium methoxide, yields the *S*-enantiomer of omeprazole, which may be converted to a pharmaceutically acceptable salt thereof.

Scheme 3

5

In Scheme 3, the first step is performed as described above. Nucleophilic substitution of the leaving group X with methoxide, e.g. sodium methoxide, is thereafter performed prior to or after reduction of the pyridine-N-oxide to pyridine.

10 The compounds of the invention may exist as tautomers. It is to be understood that the present invention encompasses all such tautomers.

The invention is illustrated by the following non-limiting examples.

Example 1. Synthesis of (S)-2-[[[4-chloro-3,5-dimethyl-2-pyridinyl)methyl]sulfinyl]5-methoxy-1H-benzimidazole

5 1.2 g (3.6 mmol) of 2-[[[4-chloro-3,5-dimethyl-2-pyridinyl)methyl]thio]-5-methoxy-1H-benzimidazole was mixed with toluene (40 mL). The mixture was concentrated until half the volume was left. Water (38 mg, 2.1 mmol), (S,S)-diethyl tartrate (1.85 g, 9.0 mmol) and titanium tetrakisopropoxide (1.0 g, 3.6 mmol) were added in the given order while stirring. The mixture was then stirred at 50°C for an hour and then *N,N*-
10 diisopropylethylamine (0.46 g, 3.6 mmol) was added at room temperature. After 15 minutes cumene hydroperoxide (80% in cumene, 0.69 g, 3.6 mmol) was added dropwise and stirring was then continued for 2 h at room temperature. The optical purity of crude sulfoxide turned out to be 75 % ee as determined by chiral HPLC analysis of the solution. The mixture was washed with water and then evaporated. The product was purified by
15 chromatography on silica gel using methanol/dichloromethane as eluent (gradient, 1-7 % MeOH) and this afforded 1.0 g of a crude product as a solid. Recrystallisation from hot acetonitrile gave 0.35 g of a white solid with an enantiomeric excess of 51%. Next, the mother liqueur from the filtration was concentrated and this material was then also recrystallised from acetonitrile to give 0.35 g of the title compound as a crystalline product
20 with an enantiomeric excess of 92.5 %.

¹H NMR of the most enriched fraction (92.5 % ee) in chloroform-*d* ; 2.3 (s, 3H), 2.4 (s, 3H), 3.8 (s, 3H), 4.8 (AB-system, 2H), 7.0 (dd, 1H), 7.0 (b, 1H), 7.5 (b, 1H), 8.2 (s, 1H).

Example 2. Synthesis of (S)-2-[[[4-nitro-3,5-dimethyl-2-pyridinyl)methyl]sulfinyl]5-methoxy-1H-benzimidazole

In an analogous experiment as in Example 1 - starting from 1.2 g of (S)-2-[[[4-nitro-3,5-dimethyl-2-pyridinyl)methyl]thio]5-methoxy-1H-benzimidazole - 1.0 g of the title compound as a crystalline product was obtained. The enantiomeric excess of this crude product was determined to be 48 % by chiral HPLC analysis.

PRV04.02.27

Claims

1. A compound of formula I either as a single enantiomer or in an enantiomerically enriched form

I

wherein

- Het is

- and X is a leaving group such as a halogen (F, Cl, Br, I), NO₂, N₂⁺ or OSO₂R (R is CH₃, CF₃, p-toluene, m-chlorobenzene, p-chlorobenzene), and tautomers thereof.
2. 2-[[4-Chloro-3,5-dimethyl-2-pyridinyl)methyl]sulfinyl]5-methoxy-1H-benzimidazole either as a single enantiomer or in an enantiomerically enriched form, and the tautomer thereof.

3. 2-[[[4-Nitro-3,5-dimethyl-2-pyridinyl)methyl]sulfinyl]5-methoxy-1*H*-benzimidazole either as a single enantiomer or in an enantiomerically enriched form, and the tautomer thereof.

4. 2-[[[4-Chloro-3,5-dimethyl-1-oxidopyridin-2-yl)methyl]sulfinyl]-5-methoxy-1*H*-benzimidazole either as a single enantiomer or in an enantiomerically enriched form, and the tautomer thereof.

5. 2-[[[4-Nitro-3,5-dimethyl-1-oxidopyridin-2-yl)methyl]sulfinyl]-5-methoxy-1*H*-benzimidazole either as a single enantiomer or in an enantiomerically enriched form, and the tautomer thereof.

10

6. A process for enantioselective synthesis of a sulfoxide of formula I either as a single enantiomer or in an enantiomerically enriched form

I

15

wherein

Het is

or

20

and X is a leaving group such as a halogen (F, Cl, Br, I), NO₂, N₂⁺ or OSO₂R (R is CH₃, CF₃, p-toluene, m-chlorobenzene, p-chlorobenzene), characterized in that a pro-chiral sulphide of the formula II

II

wherein Het is defined as above,

i) is oxidised in an organic solvent with an oxidising agent and in the presence of a chiral titanium complex and a base, or

ii) is oxidised in an organic solvent with an oxidising agent and in the presence of a chiral titanium complex, optionally in the presence of a base, wherein the titanium complex has been prepared in the presence of the pro-chiral sulphide, or

iii) is oxidised in an organic solvent with an oxidising agent and in the presence of a chiral titanium complex, optionally in the presence of a base, wherein the titanium complex has been prepared during an elevated temperature and/or a prolonged preparation time, or

iv) is oxidised in an organic solvent with an oxidising agent and in the presence of a chiral titanium complex, optionally in the presence of a base, wherein the titanium complex is prepared in the presence of the pro-chiral sulphide and during an elevated temperature and/or during a prolonged preparation time

7. A compound of Formula II

15

II

wherein

Het is

and X is a leaving group such as a halogen (F, Cl, Br, I), NO₂, N₂⁺ or OSO₂R (R is CH₃, CF₃, p-toluené, m-chlorobenzene, p-chlorobenzene), and tautomers thereof.

- 10 8. A process for synthesizing *S*-5-methoxy-2-[[4-methoxy-3,5-dimethyl-2-pyridinyl)-methyl]sulphinyl]-1*H*-benzimidazole using as starting material a compound according to Formula I, wherein the leaving group is replaced by methoxide, or alternatively the leaving group is replaced by methoxide prior to or after reduction of the oxidopyridine to pyridine.

- 15 9. *S*-5-Methoxy-2-[[4-methoxy-3,5-dimethyl-2-pyridinyl)-methyl]sulphinyl]-1*H*-benzimidazole prepared by a process comprising a combination of steps from the process defined in claims 6 and 8.

- 20 10. A pharmaceutical preparation comprising the *S*-5-methoxy-2-[[4-methoxy-3,5-dimethyl-2-pyridinyl)-methyl]sulphinyl]-1*H*-benzimidazole and a pharmaceutically acceptable carrier or diluent characterized in that the *S*-5-methoxy-2-[[4-methoxy-3,5-

Abstract

The present invention relates to an improved method for the synthesis of the (*S*)- or (*R*)-
enantiomer of omeprazole, characterized in that 2-[[4-X-3,5-dimethylpyridin-2-
5 yl)methyl]thio]-5-methoxy-1H-benzimidazole or 2-[[4-X-3,5-dimethyl-1-oxidopyridin-2-
yl)methyl]thio]-5-methoxy-1H-benzimidazole, wherein X is a leaving group, is oxidized
into the corresponding sulphoxide which is obtained as a crystalline compound.
Recrystallisation of the thus obtained sulphoxide results in a compound of enhanced
chemical and optical purity, which is subsequently transformed into the (*S*)- or (*R*)-
10 enantiomer of omeprazole.
